Audit & Risk Analytics – Expanded Analysis Report (2022)

Power BI–Driven Internal Audit & Risk Assessment

This report provides an in-depth audit and risk analysis using Power BI dashboards, combining detailed narrative insights with visual evidence to support governance and decision-making.

1. Executive Summary

This report presents a comprehensive audit and risk assessment based on audit data from 2022. Using a Power BI Audit & Risk Analytics Dashboard, the analysis evaluates audit observations, risk ratings, remediation actions, and branch-level performance. Key findings highlight significant exposure in financial controls, food safety compliance, and inventory management, with several observations remaining partially resolved.

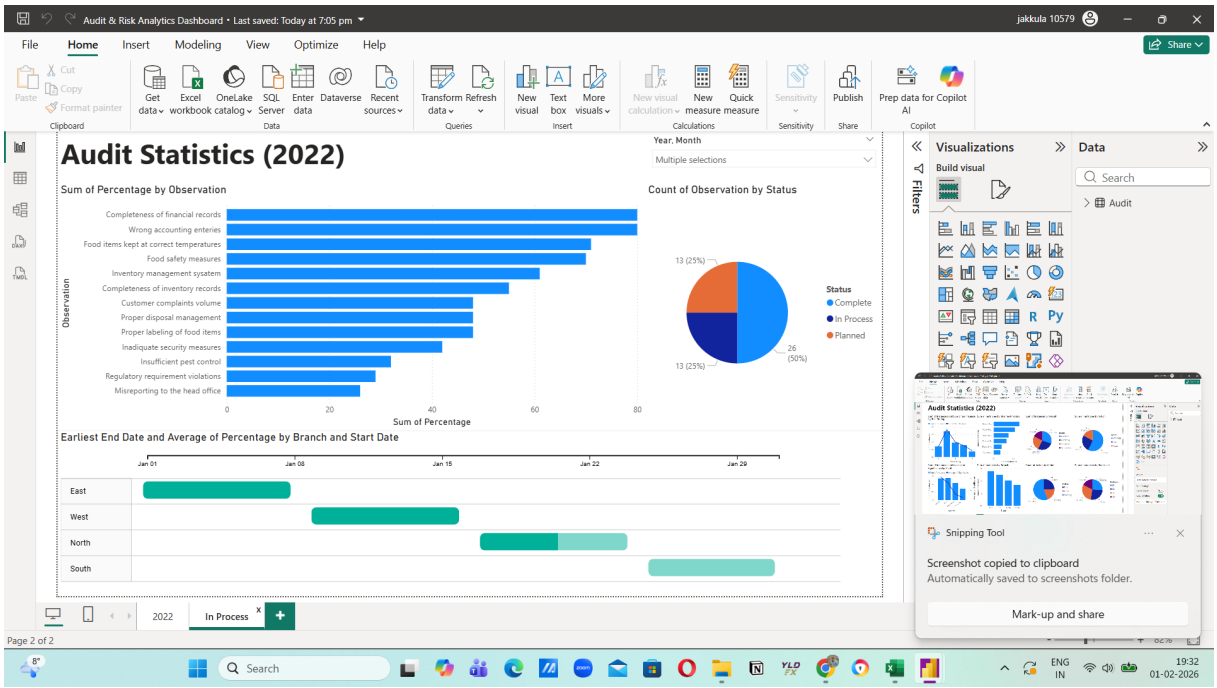
2. Data Scope & Methodology

The analysis covers the full audit year 2022 and is based on Food Chain Audit data. Power Query was used for data cleansing and validation, while DAX measures were applied to calculate risk significance, observation frequency, and audit status distributions. This ensures data integrity, consistency, and audit traceability.

3. Overall Risk & Observation Analysis

Audit observations show repeated findings across multiple branches, indicating systemic control weaknesses. Rather than isolated incidents, these patterns reflect underlying issues in process design, implementation, and monitoring.

Figure 1: Audit Statistics – Risk Rating, Business Process & Enforcement Overview



4. Risk Rating & Significance Analysis

Lower risk ratings occur more frequently, while higher risk ratings contribute disproportionately to overall risk significance. This indicates a reactive risk management environment where issues are addressed post-escalation rather than prevented.

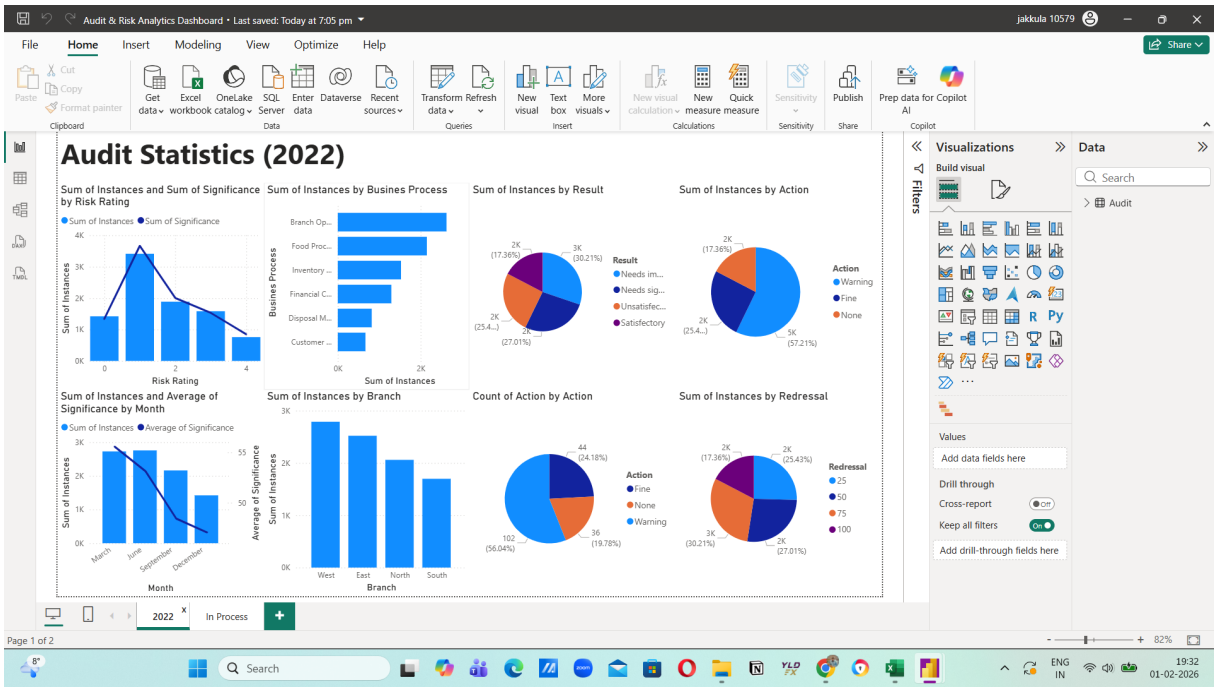
5. Business Process Exposure

Branch operations, food processing, inventory management, and financial controls exhibit the highest risk exposure. Weak upstream processes cascade into downstream compliance failures.

6. Audit Results & Enforcement

Most audit results fall under 'Needs Improvement' or 'Needs Significant Improvement'. Warnings dominate enforcement actions, suggesting corrective intent but limited deterrence.

Figure 2: Risk Results, Actions & Redressal Distribution



7. Observation-Level Risk Analysis

Financial record completeness, accounting accuracy, food safety controls, and inventory systems represent the highest-risk observations. These are highly regulated areas with significant compliance impact.

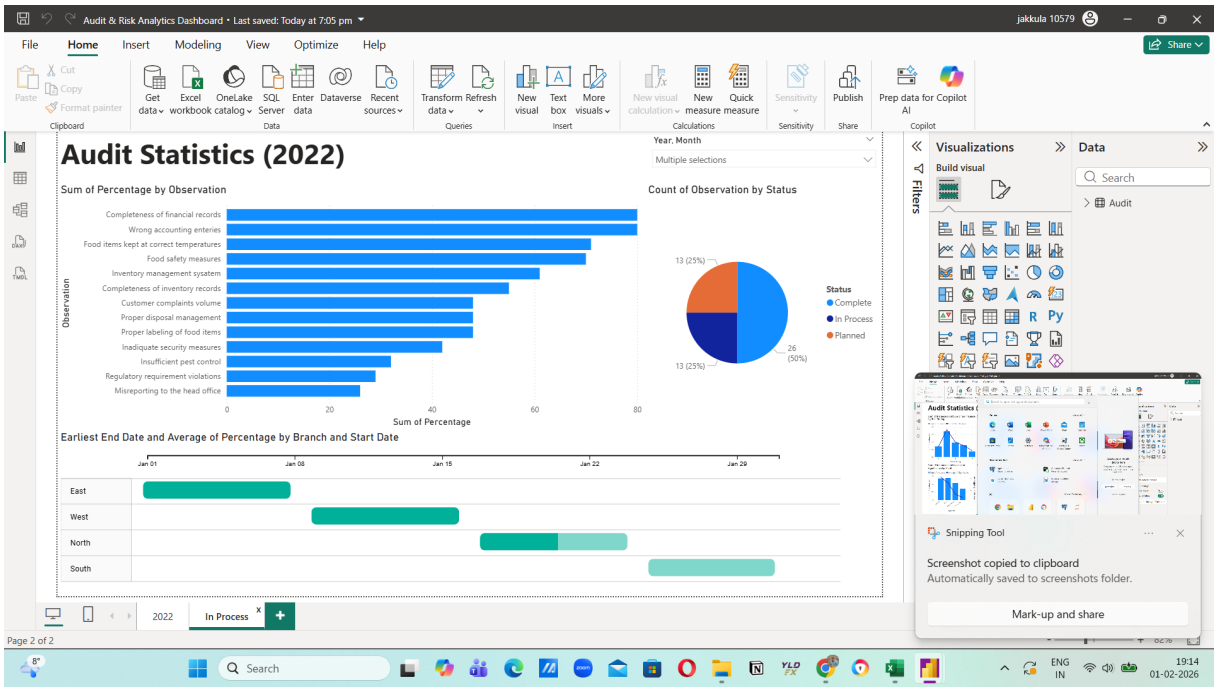
8. Audit Status & Progress Review

Only half of audit observations are complete, with the remainder in progress or planned. Delayed remediation increases residual risk and reduces audit effectiveness.

9. Branch & Regional Performance

Audit timelines vary significantly across regions, reflecting differences in resource availability, control maturity, and management oversight.

Figure 3: Observation Risk Distribution & Audit Status



10. Key Risks Identified

Key risks include financial misreporting, food safety non-compliance, inventory inaccuracies, delayed remediation, and inconsistent governance across branches.

11. Recommendations

Management should adopt a risk-based audit prioritisation framework, implement continuous monitoring, accelerate closure of high-risk findings, and standardise controls across regions.

12. Conclusion

This report demonstrates how Power BI–driven audit analytics enable proactive risk management, improved governance, and data-driven decision-making.
